

Magnificent Earth®

A Soil Enriching Organic Fertilizer

-Features-

- F**riendly Controlled nutrient release happens slowly over several weeks through natural breakdown and decay of nutrients eliminating the chance of burning your lawn, garden or shrubs.
- E**conomical Slow release of nutrients results in a controlled growth rate reducing mowing frequency, which saves time and money.
- R**esistance Turf, Trees, and Shrubs resist heat and cold stress better when fed our fertilizer.
- T**urf Density of turf increases naturally choking out weeds.
- I**ngredients Clean Ingredients. No sewer sludge (which can contain heavy metals), manure, blood, feathers or slaughter waste.
- L**uster The brilliant appearance of your lawn will make your neighbors inquire.
- E**nvironment Nitrogen and phosphate runoff is reduced to nearly zero which is more responsible to the environment.

A superior organic fertilizer for...

Lawn Turf. In early March apply 20 lbs per 1000 square feet. Water thoroughly over the next two or three days. You will notice a light organic odor as the product activates and begins to break down. The odor will dissipate over the next few days. Reapply as needed to maintain the lawn quality you want. (Usually every 2-3 months).

Maximum Lawns or Damaged Turf. Apply as described above except use 30 lbs per 1000 square feet.

Trees and Shrubs. Generously spread around the drip line of trees and shrubs. Spread out so the fertilizer is not mounded and water thoroughly.

Vegetables and Flowers. Sprinkle around plants and seeds generously, water thoroughly. Reapply monthly during the growing season.

*store in a dry area

Magnificent Earth®

A Soil Enriching Organic Fertilizer

Key Ingredients

CORN GLUTEN MEAL: This all natural food ingredient that contains 10.00% organic nitrogen. This slow release nitrogen ingredient adds lush green healthy growth to all plants and turf. The level used in the product does not inhibit seed germination so you can use it with confidence when seeding lawns or gardens.

SOYBEAN MEAL: Another high quality natural high protein food ingredient which supplies over 7.50 % organic nitrogen plus organic phosphorous. This nitrogen source does release more rapidly than the other organic nitrogen sources in this product. This allows a rapid green up of lawn turf and growth in all plants.

SUNFLOWER MEAL: The third natural food ingredient that contributes around 5.50% organic slow release nitrogen. Also provides organic magnesium, potassium and phosphorous to enrich soil and improve plant growth and natural disease resistance.

DRIED MOLASSES: Contains natural sugars that feed and rapidly increases the number of healthy soil microorganisms. More soil microorganisms increase the rate of breakdown and decay of thatch and other plant material into humus. This makes your soil more fertile quicker and adds to the soils moisture holding capacity. Rich in organic iron also that greatly increases deep green color of turf and leaves.

ALFALFA MEAL: Rich in natural nitrogen, calcium and trace minerals. Natural fibers break down quickly to humus adding nutrients and moisture retention capacity to soil.

KELP MEAL: One of nature's most amazing plants. This dried seaweed from the kelp variety is rich in natural micronutrients and trace minerals including iodine. Helps build the natural plant immunity level while increasing flower and vegetable production. Amazingly vivid colors in all plants come from proper kelp application.

YEAST CULTURE: Organic enzyme rich ingredient that increases the rate of organic matter breakdown. Helps break down the organic fertilizer itself and lawn thatch into humus that further feeds all plants by increasing friendly bacteria and microbes vital to healthy plant growth.
